HISTORY

Version 1.3 has been enhanced compared with the previous version and now includes "Transfer data for AVLC". This allows information concerning planned transfers to be transferred from a planning system to an AVLC.

In **Version 1.4** intermediate points were introduced in patterns to support a graphical representation.

Version 1.5 now includes the modelling of zones, references to the new NeTEx European standard and extensions in the area of journey connection.

Version 1.6 now includes modelling for electromobility

| Date | Author | Change | New |
|------------|--------------------------------|---|---------|
| | | | version |
| 16/11/2004 | W. Bruns | New in chapter 10: Extension of the "Transfer protection" function Additions to chapters 5.1 and 8.2 concerning transfer data | 1.3 |
| | | With the creation of Version 1.2, the file codes for the BASE_VERSION_VALID (BASIS_VER_GUELTIGKEIT) and BASE_VERSION (MENGE_BASIS_VERSIONEN) tables have been exchanged. | |
| | | Incorrect: BASE VERSION VALID (BASIS VER GUELTIGKEIT) 485 | |
| | | BASE_VERSION_VALID (BASIS_VER_GUELTIGKEIT)485BASE_VERSION (MENGE_BASIS_VERSIONEN)993 | |

| | Bruns | Telko on 26.6.13 | |
| 02/05/2019 | Winfried | Addition of DLID in LINE (REC_LID), DFID in JOURNEY | 1.5 incl. |
| | Bruns | (REC_FRT), TLID | CRs |
| | | Chapter 9.8.3 BLOCK (REC_UMLAUF): The description of | 2019 |
| | | END_POINT (END_ORT) makes no sense: "Point number of the | |
| | | starting point of a block" "Starting point" should probably read "end | |
| | | point". | |
| | | | |
| | | Chapter 9.2: ZONE_POINT (FL_ZONE_ORT): Assignment of | |
| | | stopping points and border points to the zones. | |
| | | In the TABLE "JOURNEY_CONNECTION (432)", the attribute | |
| | | "RECEIVER_STOP_NO (ABB_ORT_REF_ORT)" is mentioned 2 x, | |
| | | but the attribute "RECEIVER_POINT_TYPE (ABB_ONR_TYP_NR)" | |
| | | is missing. | |
| | | In the table "JOURNEY_CONNECTION (432)", the attribute | |
| | | "FEEDER_STOP_NO (ZUB_ORT_REF_ORT)" is mentioned 2 x, | |
| | | but the attribute "FROM_STOP_NO (VON_ORT_REF_ORT))" is | |
| | | missing. | |
| 31/05/2019 | Gerald | Field "DLID" proposed on 02/05/2019 renamed as "RouteID" | |
| | Dury | | |
| 06/06/2019 | Winfried | Chapter 9.1.3 was deleted according to the task force decision of | |
| | Bruns | February 2015. | |
| 10/10/2020 | Felix Roth | Chapter 11 Electromobility added and references supplemented | 1.6.1 |

The core of this VDV Recommendation remains unchanged from Version 1.0 published in 1999. Changes are essentially restricted to value ranges and minor extensions of the structures, which should not affect the downwards compatibility of the interface.

1 Foreword to the VDV Data Model 5.0

1.1 The VDV Data Model as a Reference Point for Data Modelling in Public Transport

After the first publication of the VDV recommendation (**) "ÖPNV Data Model", also known as the "VDV Data Model" outside German territory, it has become the basis for data modelling in public transport. Many system providers have followed the VDV Data Model and used it as a basis for developing their own product data model.

Perhaps it was due to the great success of the VDV Data Model that the VDV faced increasing demands to also develop practically orientated solutions, extending even beyond the capabilities of the VDV Data Model, to act as a basis for generally understandable language rules. The ideas included standard interfaces which, thanks to their plug-in compatibility, are instantly usable, and which permit standard software modules to communicate with each other at a reasonable cost.

1.2 The VDV Interface Initiative VDV Data Model

That is why in 1998 the VDV decided to establish an initiative entitled "The VDV Interface Initiative" in order to promote the creation of standardised data interfaces based on the VDV Data Model.

These interfaces basically represent a part of the VDV Data Model. We are not therefore dealing with a new concept, but with a logical application of the VDV Data Model which was the result of many years of investigation. Provision of a more exact description and an expansion of the technical specifications concerning data transfer, as well as functional aspects, means, however, that it is more practice-oriented than was the case with the simple VDV Data Model.

This current edition of the VDV Recommendation contains the first interface definition from the initiative. It deals with the **"Route Network and Timetable"** area. The definition distinguishes itself from the VDV Data Model insofar as it has the following characteristics:

- In conjunction with SQL access as required in earlier versions of the VDV Data Model, an alternative file format is defined for off-line data transfer (see VDV Recommendation 451)
- The minimum scope of the data model is clearly outlined.
- The range of values is more restrictively defined for the individual attributes (from the user's perspective).
- The individual attributes have been described in more detail and therefore more precisely.

2 Definitions

Standard VDV "Route Network / Timetable" Interface

An interface definition based on the VDV Data Model for the transfer of route network and timetable data. It consists of a definition of the data model and the two possibilities for gaining access – SQL and VDV file format.

VDV Database

Relational database based on the VDV Data Model. The used section focuses on the data model for the Standard VDV Interfaces. The VDV database can form part of a product-specific database. Data can be transferred into and out of the VDV database using SQL or VDV file format.

VDV File Format

Qualified ASCII data format for the off-line data transfer of specified VDV Data Model data.

Standard VDV Interfaces Compatibility

A software system is regarded as being compatible when it is capable of exporting data into the VDV database or importing data from it. It does not matter whether this occurs using files in ÖPNV file format or via direct SQL access to the VDV database. In both cases, the functions and consistency tests as described in section 5.5 must be adhered to. If there are any discrepancies between the content of this recommendation and the "VDV Data Model" paper (especially as regards attribute value range), this one should be viewed as a continuation. Therefore, the information in this document is decisive.

Planning program

Software for vehicle and crew scheduling in public transport systems

AVLC

The Automatic Vehicle Location and Control System (AVLC) is the new term for automated control systems, which takes into account the increased capacity of these systems.

CMS

Charging Management System (CMS) for defining a charging strategy for vehicles in the depot, taking account of the available power consumption and the operational requirements.

3 Objectives

In the field of public transport, various manufacturers' software modules are used. Data exchange between these software modules is frequently necessary. Various departments within the transport industry and also the general public need up-to-date timetable data which is drawn up by traffic planning. For example, it is required for:

- Transit operations' supervision and control with an AVLC
- Statistics
- Passenger counting
- Counting of handicapped passengers
- Crew scheduling and personnel arrangements
- Dynamic passenger information
- Timetable information
- Depot management systems

Establishing such information flows is a very expensive procedure, especially when specific interfaces have to be written in each individual case.

The standardisation of interfaces for the exchange of data between public transport software systems as part of the "VDV Data Model Interface Initiative" therefore pursues the following aims:

- General minimisation of individual interfaces
- Avoidance of repeated updating
- Clear documentation of the standard interfaces
- Interfaces which function independently of the systems involved
- Use of the same interface for each transport company (standard product)
- Transparency of data for all systems.
- Important numerical or alphanumerical data fields (key attributes) are identically assigned in both systems.
- Uniform requirements list of the transport companies

20.04.2021

4 Limitations

The Standard VDV "Route Network / Timetable" Interface description is exclusively concerned with data describing networks and timetables. It therefore represents a section of the VDV Data Model V.4.1.

The VDV Data Model 5.0 concentrates exclusively on the data structures of interfaces between software modules in public transport systems. The individual internal data structures of the systems are not part of this specification and are also (contrary to the earlier versions of the VDV data model) omitted from any compatibility tests.

In many cases it will still make sense to compare the proprietary data model with the VDV Data Model.

5 General description

The aim of the **Standard VDV** "Route Network / Timetable" Interface is to transfer network definitions and timetables from a source system into a target system. As a general rule, the timetable data from a (vehicle and crew) scheduling programme is passed on to the consumer systems for the purpose of operation monitoring and control (AVLC), cost control and/or publication.

When transferring data from a planning system into an AVLC, the data in the AVLC can be supplemented by the user with AVLC-specific data.

Examples of data which are updated in the AVLC and which are not mapped in the **Standard VDV "Route Network / Timetable" Interface**:

- Traffic light influencing parameters
- Radio parameterisation for the AVLC
- Data for dynamic passenger information.
- Stop-related additional information
- Free texts
- Differentiation of a planned/actual comparison or combination

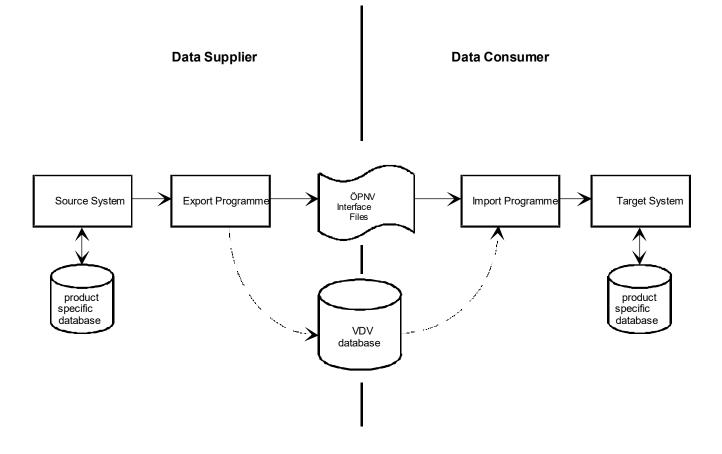

With a renewed data transfer from the **Standard VDV "Route Network / Timetable" Interface**, the AVLC-specific data, which is already included in the AVLC database, must be taken into consideration.

5.1 Scope of Data

The Standard VDV "Route Network / Timetable" Interface comprises the following data:

- Calendar data (day types and their validity in the period)
- Operational data (vehicle stock, vehicle types, announcement texts and destination texts)
- Point data (bus stops, stopping points, beacons, depots)
- Network data (route sections, distances, travel time groups, travel times, dwell times)
- Route data (routes and route sequences for different patterns)
- Timetable data (runs and run-dependent dwell times, blocks)
- In Version 1.3 (chapter 9.1) transfer data has been included in the interface, which facilitates the transfer of journey connection definitions together with their validity for example from a journey planning system to an AVLC, thus laying the foundation for the protection of and information concerning transfers.
- In Version 1.5 (chapter 10) it is now possible to use zones or administrative units.
- In Version 1.6. 1 (chapter 10) it is now possible to transfer electromobility attributes.

5.2 Data flow

5.3 Interface files

Data exchange using interface files becomes necessary under the following circumstances:

- Data is imported or exported from an external system. The data may possibly be reused on another hardware platform.
- Data must be post processed, inspected or evaluated using standard market software, for example:
- a database is to be inspected or modified using a text editor
- a database is to be imported or exported (possibly with the aid of additional macros) using a spreadsheet program

5.4 SQL Access

Access to **Standard VDV** "Route Network / Timetable" Interface data should also be possible via an SQL interface which enables direct (interactive) access to the VDV database. This means that data in the VDV Database can be modified, deleted or selectively downloaded.

5.5 Requirements on the files

Formal Conditions

- The data structure (tables, attributes, value ranges) corresponds to the description published in this recommendation.
- Data transfer takes place via VDV interface files or via SQL access
- The integrity of the references for the route network and timetable data must be guaranteed by the exporting system.
- The consistency and completeness of the database must be checked by the system which is exporting the data.

Logical and content-related conditions

A prerequisite for the successful implementation of the interface is that the logical and content-related relationships of the route network and timetable data have been correctly mapped. This includes, for example, that

- the departure times of successive trips can be upheld on the basis of the underlying route definitions,
- the data elements are uniquely identifiable (e.g. unique stop codes, route numbers, pattern numbers per route, run numbers per route, block numbers).
- blocks have unbroken coverage, beginning with exit from the depot as far as return into the depot.

The logical and content-related conditions are already guaranteed by the data supplier when the data is exported.

Individual conditions will be dealt with in the specifications (further below).

Apart from the conditions described in this recommendation issue, **operational conditions** must also be met if export of data for an AVLC is planned.

Example: Data transfer from the Interplan transport planning system to LIO-Data in order to update the LIO AVLC

- Some planning systems only record those runs which are operated by a transport company on a
 productive level (e.g. for the production of timetable information). In order to achieve an exact model of
 operational activity and successfully update all the AVLC components, all runs should in fact be
 recorded in the planning system.
- If a transport company uses trams, turning loops are often employed at the terminal stops of these
 routes. If the turning loop data (e.g. distances and stopping points) is not transferred from Interplan to
 LIO-Data via the VDV-Import function, this path data is missing for the relevant AVLC components and
 must be manually recorded in LIO-Data. This leads to a significantly increased data management
 workload in LIO-Data, which could be avoided by completing the route and timetable data accordingly in
 Interplan. The VDV import only accepts the data that is made available to it, which it then converts for
 the LIO operations control system. It does not make any changes at the pattern or timetable level.
- The distances between the stops must be measured exactly and entered in the Interplan planning system (accurate to within one metre), as these measurements along with the beacons and GPS coordinates form the basis for the logical location process of the AVLC.
- The journey times between the bus stops and the stopping times should also be recorded as exactly as possible (in seconds), as the timetable theoretical versus actual comparison depends on these values. If the times are recorded to the nearest minute, then the timetable comparison cannot deliver exact results either at the control centre or on the on-board vehicle computer.
- The quality of the distances and times measured in the planning system has a direct effect on the operation of the AVLC. That is because this data forms the basis for the navigation, dynamic passenger information, transfer protection and statistics etc.

6 Application areas

6.1 Export Route Network / Timetable

The specification enables a data supplier to convert product-specific route network and timetable data into a standardised format. An application for data export could be considered for:

- Journey scheduling programs (e.g. for supplying an AVLC system) or
- AVLC, for supplying a company database.

6.2 Import Route Network / Timetable

The specification enables the data consumer to convert standardised route network and timetable data into product-specific data. An application for data import could be considered for:

- AVLC system (from vehicle and crew scheduling programs)
- Timetable information
- Ticket printer
- Passenger counting
- Company traffic database
- -

6.3 Route Network / Timetable Data Exchange

A data transfer system based on the Standard VDV "Route Network / Timetable" Interface is notable for its controlled redundant database organisation. This means that the route network and timetable data is only recorded and updated in a source system (e.g. in the scheduling program) and is transferred to the data consumer (e.g. AVLC) for further processing. The database in the target system therefore corresponds to a mapping of the data in the source system. The data consumers have their own data management in their product-specific databases.

The data consumers (target systems) generally require further internal data for their operation to be productive. It cannot always be supplied by the source system (e.g. with an AVLC, the beacons and their position on the route sequence) and must therefore be completed in the target system.

Data adjustment in the consumer system through data import

20.04.2021

If new data is imported from the source system during a data transfer, then this new data must be compared with the data in the target system by the import program. This process can be performed by a so-called update function, which, when importing the data, re-uses the target system specific data as much as possible. The comparison between the source system interface data and the data which is already present in the target

18

system must be undertaken in a logical sequence. The data must first be read, then compared or completed and only then imported by the target system.

For example, beacons are provided along the route sequence of an AVLC system. A new data transfer using an identical route sequence and different run and stopping times should not affect these beacon positions.

Data Comparison in the Source System by Updating

When transferring data from a source system into the target system via interface files or SQL access, existing data is replaced by the new data. If, as an exception, the changes to the data are made in the target system directly, then you have to make sure, prior to the next data exchange, that the corresponding changes were also made in the source system. If no such updating occurs in the source system, then the changes to data in the consumer system will be overwritten when the next data exchange takes place.

7 Compatibility

Application software interfaces may be compatible with the interface described here. The following conditions must be met:

- The interface must use exactly the same data model as described in this publication.
- The data must be stored in VDV file format and / or in a relational database.
- The interface must be available to transport companies as a product of the provider.
- It must be applicable independently of individual customers.
- In order to achieve an exact model of operational activity and successfully update all the AVLC components, all runs should in fact be recorded in the planning system.

Compatibility only applies to the published version of the interface program. Changes to the interface program make another test necessary. On the request of the software provider, the test is carried out by the VDV. The VDV publishes the compatibility of an interface among others in this Recommendation.

Depending on the eventual use, various types of compatibility with the interface description are possible:

• An **export compatibility** exists if the software's own database can provide route network and timetable data for another application.

A certain minimum scope is required. The corresponding tables in the recommendation, listed in the "Minimum scope of the AVLC" column, are marked with a black square.

- **Import compatibility** can apply when a software (target system) adopts route network and timetable data from another system and maps them with the correct content in its own data management.
- If data is going to be used in an AVLC, a **minimum scope** is required (the corresponding tables in the recommendation, listed in the "Minimum scope of the AVLC" column, are marked with a black square). An interface which is capable of doing this is designated as **import compatible for AVLC**.
- **Full compatibility** comprises export compatibility and import compatibility for AVLC, i.e. data exchange in both directions.

Scope of the implemented interface

The specification to hand describes the minimum scope of an interface. Scheduling programs (e.g. to update an AVLC system) or an AVLC system e.g. to update a company database.

Suggestions for the standard interface to expand to include further tables are welcome. The VDV will examine these and publish them in a subsequent issue of the recommendation.

20.04.2021

8 Compatible Products

The official VDV website, <u>WWW.VDV.DE/oepnv-datenmodel.aspx</u>, lists and describes the products (interfaces) that are compatible with the Standard VDV "Route Network / Timetable" Interface. In some cases a compatible version of the interfaces is still nowhere in operation but has nevertheless been planned (depending on orders). Corresponding annotations have been made.

The use of these products is recommended by the VDV, since, by using them as a basis, the information flow between software applications in public transport systems is facilitated. This recommendation <u>only</u> refers to the capability of the software in question to export or import data via the Standard VDV Interface. <u>No statement</u> can be made here regarding the general quality of the software and especially regarding its ability to fulfil company requirements.

In order to achieve compatibility status, the software manufacturer had to:

- provide the VDV with a performance description of the interface including data model, product name and version and
- prove that the interface performed according to the description.

Details regarding points for installation are pending further information from the software providers.

8.1 Application Matrix for Relations

A prerequisite for <u>successful</u> coupling of two products is, in addition to being compatible with the interface description as published in this recommendation issue, that the source system is capable of delivering the relations which are required by the target system.

When data exchange takes place, basically all the tables contained in the Standard VDV "Route Network / Timetable" Interface are transferred. Depending on what products are involved, it is however possible that some tables will be transferred empty.

The tables on the official VDV website (<u>WWW.VDV.DE/oepnv-datenmodel.aspx</u>) show the relations that are supported by the various products.

For good coupling possibilities to exist, it is generally very important to have **the largest possible number of supported relations (x)**.

In an actual coupling, it is desirable that all relations which can be imported by the receiving system are then also delivered by the exporting system. Manual updating is also possible. Under no circumstances should the tables be interpreted as meaning that only the products that have the same marked relations (**x**) can be coupled!

9 Standard VDV Route Network / Timetable Interface Description

9.1 Data Model Structure

The data descriptions are divided into 6 groups, based on content:

- Calendar data
- Point data
- Operating data
- Network data
- Route data
- Timetable data

Each area is introduced by a short explanation about its basic concept.

The meaning of the relations, as well as their attributes, is explained using short descriptions. Data types and key properties for the attributes are listed in table form.

9.1.1 Notation System

- Relations which are necessary for transferring route network definitions and timetable data into an AVLC system, are indicated in the "Required for" column with the letters "AVLC". "AVLC" (bold) indicates a key attribute, which is used for data matching with an Automatic Vehicle Location and Control System (AVLC).
- Relations which are necessary for transferring electromobility data to a charging management system are indicated in the "Required for" column with the letters "CMS" (for example via depot management system or AVLC).
- The key property of the attributes is indicated by a "P" when it is the primary key. The keys are generally compound in nature, with the result that the record is only uniquely identifiable when all the key attributes are examined together. Attributes which enable clear record access are indicated by a "C".
- Attributes which were not present in the VDV Data Model v. 4.1 are indicated in the relation description using *italics*.
- Value ranges may differ (in that they are usually larger) than those in data model 4.1. No specific reference is made here.

9.1.2 Data Types

The data types used in the Route Network / Timetable Interface Description have been taken from the VDV Data Model v. 4.1. Here they are explained with examples:

| decimal (x) | Decimal value, whereby x represents the maximum number of places |
|-------------|---|
| char(x) | Character string, whereby x represents the maximum number of characters |
| Boolean | Logical type: 0 = FALSE / 1 = TRUE |

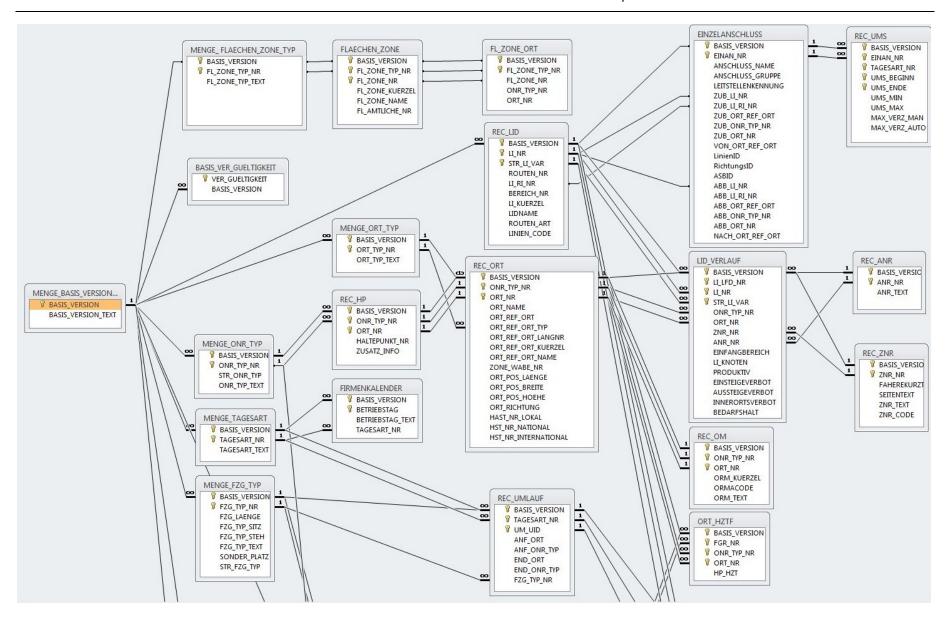

9.1.3 Times

All times are managed in seconds.

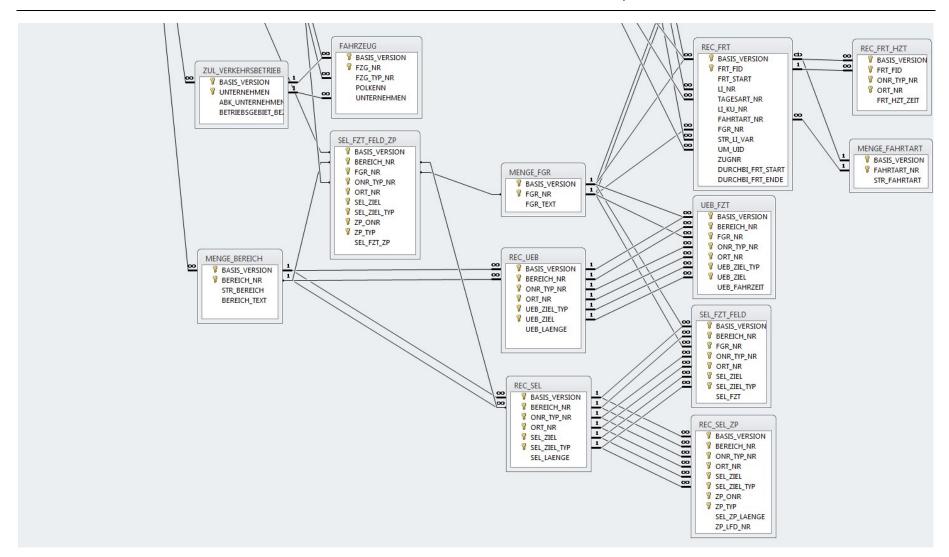

9.1.4 Diagram of the Data Model

BASE_VERSION

9.4.3 STOP_POINT (REC_HP) (229)

Description:

Points are the smallest units in timetable scheduling. Generally, passengers get on and off at a stopping point. Each stopping point must be assigned to a bus stop or depot. A bus stop / depot can have a maximum of 100 stopping points assigned to it. No stopping points with the same number are allowed for one bus stop/depot.

| Table: STOP_POINT (REC_HP) | | | | | |
|----------------------------|----------------|-----------|-------------|--------------|-------------|
| Key | Attribute Name | Data type | Value range | Required for | Description |

STOP BASE_VERSION POINT_TYPE

9.4.4 ACTIVATION_POINT (REC_OM) (295)

Description:

Assigning point markers to points including details of coding

Explanation: For the purpose of tracking vehicle positions, AVLC systems can use (in addition to other possibilities) wayside point beacons, which transmit a signal when a vehicle passes or send a specific code in response to an active vehicle request. The locations of such beacons can be stored as POINT MARKER (ORTSMARKEN) in the ACTIVATION_POINT (REC_OM) relation. A POINT_MARKER (ORTSMARKE) is essentially a POINT of a specific type, to which a specific code has been assigned, which in turn allows the system to update the vehicle position when it passes by. The POINT_MARKER therefore has a 1:1 relationship with a POINT (ORT) saved in STOP (REC_ORT).

| Table: ACTIVATION_POINT (REC_OM) | | | | | | |
|----------------------------------|----------------|-----------|-------------|--------------|-------------|--|
| Key | Attribute Name | Data type | Value range | Required for | Description | |

| P ₁ , C ₁ | BASE_VERSION (BASIS_VERSION) | decimal (9) | >0 | Label of the general version |

BASE_VERSION POINT_TYPE STOP

9.4.5 STOP (REC_ORT) (253)

Description:

Description of points. All the points on the network are contained in this relation. There is also a description of how the geo nodes are formed into area groups. A bus stop / depot can be made up of several stopping points (e.g. when travelling a route in both directions). In this relation, this is highlighted by references between the network points which belong together. A bus stop / depot can have a maximum of 100 stopping points assigned to it. No stopping points with the same number are allowed for one bus stop/depot. The code (STOP_ABBR (ORT_REF_ORT_KUERZEL)) and the (STOP_NO (ORT_REF_ORT)) number must be unique across all stops and depots.

| Table: STOP (REC_ORT) | | | | | |

9.6 Network data

9.6.1 LINK (REC_SEL) (299)

Description:

Defines directed (one-way) connections in the network by indicating the geometrical points (bus stops / stopping points or depots / depot points) which form the beginning and end of a route. This means that routes in two different directions can exist between two stopping points. The connection distance is given in metres.

| Table | Table: LINK (REC_SEL) | | | | | | |
|----------------|---------------------------------|----------------|-------------|--------------|--|--|--|
| Key | Attribute Name | Data type | Value range | Required for | Description | | |

Note: The "approach" is a path which is used especially for route change-over journeys and empty runs.

9.6.9 ZONE (FLAECHEN_ZONE) (571)

Description:

Description of the zones. A zone is a spatially connected geographical region. The individual zones in the ZONE (FLAECHEN_ZONE) table need not necessarily be disjointed. The zones can overlap. One application of the zones is the division into political regions, the so-called administrative units. An administrative unit is a legal body that has the territorial jurisdiction for a specific area of the county. The administrative units can be assigned on different levels. Examples include the communal administrative units of rural areas, cities, districts and municipalities.

| Table | Table: ZONE (FLAECHEN_ZONE) | | | | | |

9.7 Route data

9.7.1 ROUTE_SEQUENCE (LID_VERLAUF) (246)

Description: Describes the route sequence by listing the bus stops / points which are stopped at in numbered sequence. Bus stops / stopping points (depots / depot points) may only be served once within the route sequence (no circular routes). Circular routes are depicted by representing the repeatedly served stops as different points (stopping points) with the same reference point (stop). The total travel time for a route sequence cannot be zero. The same applies to distance. The beginning and end points of a route sequence must be junctions (time-relevant points). SEQUENCE_NO (LI_LFD_NR) describes the route sequence, which lists the stops and stopping points to be served as a sequence of incrementally increasing numbers (e.g. 1,4,6,8 represents a valid sequence).

| Table: ROUTE_SEQUENCE (LID_VERLAUF) | | | | | |
|-------------------------------------|----------------|-----------|-------------|--------------|-------------|
| Key | Attribute Name | Data type | Value range | Required for | Description |

| P ₁ , C ₁ | BASE_VERSION (BASIS_VERSION) | decimal (9) | >0 | AVLC | Label of the general version |
|------------------------------------|---------------------------------|----------------|------------|------|--|
| P ₄ | SEQUENCE_NO (LI_LFD_NR) | decimal (3) | >0 | AVLC | Consecutive number of the point on the route sequence |
| P ₂ , C ₂ | ROUTE_NO (LI_NR) | decimal (6) | 19999 | AVLC | Identifier of the transport supply in terms of route or direction ⁷ |
| P ₃ , C ₃ | ROUTE_ABBR (STR_LI_VAR) | char(6) | ISO 8859-1 | AVLC | Identifier of the variant on the route (or pattern sequence in a specific direction) |
| C ₄ | POINT_TYPE (ONR_TYP_NR) | decimal (2) | 1 - 2 | AVLC | Identifier of the functional type of a point <point type=""></point> |
| C ₅ | POINT_NO (ORT_NR) | decimal (6) | >0 | AVLC | Point identifier per functional point type <point number=""></point> |

⁷ In AVLC operation, it is necessary to check whether the entire range of values can be used. Many transport authorities use components,

whose route numbers are restricted to the value range of

^{1 - 999}

Interface description

| r | | | | r | 1 |
|---|---|----------------|--------------|------|---|
| | DEST_NO (ZNR_NR) | decimal (4) | 0-9999 (0) | AVLC | Identifier of the destination display |
| | ANN_NO (ANR_NR) | decimal (4) | 1-9999, NULL | AVLC | Identifier of the announcement |
| | LOCKIN_RANGE (EINFANGBEREICH) | decimal (3) | 0-256 (0) | AVLC | Area in metres within which the on- board computer recognises the bus stop / stopping point |
| | LINE_NODE (LI_KNOTEN) | Boolean | 0 - 1 (1) | AVLC | 0: Not a timing point 1: Timing point |
| | PRODUCTIVE (PRODUKTIV) | Boolean | 0 - 1 (1) | | Specifies whether it is a normal trip (with passengers) or a depot trip (e.g. pull-out). ⁸ |
| | NO_BOARDING (EINSTEIGEVERBO T) | Boolean | 0 - 1 (0) | | Passengers are not permitted to board the vehicle here ⁹ ¹⁰ |
| | NO_ALIGHTING (AUSSTEIGEVERBO T) | Boolean | 0 - 1 (0) | | Passengers are not permitted to leave the vehicle here ^{11 12} |
| | CITY_BAN (INNERORTSVERBO T) | Boolean | 0 - 1 (0) | | It is forbidden for passengers to board or alight vehicles within the city limits (generally applies to regional journeys from and to the countryside) ¹³ |
| | REQUEST_STOP (BEDARFSHALT) ¹⁴ | Boolean | 0 - 1 (0) | | Bookable stop along a trip (the vehicle stops at the request of the passenger). |

⁸ The field is optional. If not delivered, the specification in TRIP_TYPE_NO (FAHRTART_NR) is valid (e.g. normal trip). Partial sections (i.e. edges defined by two table records) with PRODUCTIVE (PRODUKTIV)=0 can only exist at the start or end of a path. There must only be one connected area with PRODUCTIVE (PRODUKTIV)=1. Paths can be composed exclusively of sections with either PRODUCTIVE (PRODUKTIV)=1 or PRODUCTIVE=0.

When transferring the schedule times, both the productive and unproductive sections must be provided with times.

⁹ optional

¹⁰For a pass-by, both the no-boarding and no-alighting elements should be set to 1 (true).

¹¹ optional

¹²For a pass-by, both the no-boarding and no-alighting elements should be set to 1 (true).

¹³ optional

¹⁴ Besides the regular fixed stops, trips with flexible service may contain demand-oriented stops that can already be marked in the planning programs.

9.7.2 LINE (REC_LID) (226)

Description:

Allocation of the route (sometimes referred to as line) to the operational branch. The route number within a network is unique. The pattern number must be uniquely assigned to a route and route sequence. LINE_ABBR (LI_KUERZEL) must have the same value for all patterns on the same route (LINE_NO (LI_NR)).

| Table | : LINE (REC_LID) | | | | |
|------------------------------------|---------------------------------|----------------|-------------|--------------|--|
| Key | Attribute Name | Data type | Value range | Required for | Description |

ROUTE_SEQUENCE CHARGING_PROCESS

BASE_VERSION OPERATING_DEPARTMENT

9.8 Timetable data

9.8.1 JOURNEY (REC_FRT) (715)

Description:

Journey definition in "Information on Scheduling Journeys". Result of the journey relationship investigation, according to which linked routes are brought together to form complete journey relations, also taking into account admissible route changes (reassignments). The run number is used to uniquely assign the vehicles on a route to a timetable. In so doing, the runs identify all the vehicles which are being used at a certain point in time. The course of journey number gives no information about the number of vehicles which are being used at any given time point. The course of journey number is unique within the line and for the time during which the vehicle in question is on the line.

| Table: | JOURNEY (REC_FRT) | | | | |
|--------|-------------------|-----------|-------------|-----------------|-------------|
| Key | Attribute Name | Data type | Value range | Required for | Description |

| P ₁ , C ₁₁ , C ₂₁ | BASE_VERSION (BASIS_VERSION) | decimal (9) | >0 | AVLC | Label of the general version |
|--|---------------------------------------|-----------------|------------|------|---|
| P ₂ | JOURNEY_NO (FRT_FID) ³⁾ | decimal (10) | >0 | AVLC | Identifier of journey |
| C15, C24 | DEPARTURE_TIM E (FRT_START) | decimal (6) | 0 - 129600 | AVLC | Journey departure time in seconds from 0:00 |
| C ₁₃ | ROUTE_NO (LI_NR) | decimal (6) | 1 - 9999 | AVLC | Identifier of the transport supply in terms of route or direction |
| C ₁₂ , C ₂₂ | DAY_TYPE_NO (TAGESART_NR) | decimal (3) | 1 - 999 | AVLC | Day type label |
| C ₁₄ | RUN (LI_KU_NR) ¹⁾ | decimal (6) | 1-99, NULL | AVLC | Run number of a block within a route |
| | JOURNEY_TYPE (FAHRTART_NR) | decimal (2) | 1 - 4 | AVLC | Identifier of the type of journey |
| | TIMING_GROUP_ NO (FGR_NR) | decimal (9) | >0 | AVLC | Identifier of the travel time group |

| | ROUTE_ABBR (STR_LI_VAR) | char(6) | ISO 8859-1 | AVLC | Identifier of the variant on the route (or pattern sequence in a specific direction) |
|-----------------|--|----------------|-------------|------|--|
| C ₂₃ | BLOCK_NO (UM_UID) | decimal (8) | >0, NULL | AVLC | Identifier of the vehicle block |
| | TRAIN_NO (ZUGNR) | decimal (7) | >0 | | This is the train number that is presented to the passenger via the printed timetable. |
| | THROUGH_START (DURCHBI_FRT_S TART) ²⁾ | Boolean | 0 - 1 (0) | | The field content is 1 (logic true), if passengers are allowed in the vehicle from the start of the trip (occupancy at the start of the trip > 0). |
| | THROUGH_END (DURCHBI_FRT_E NDE) ²⁾ | Boolean | 0 - 1 (0) | | The field content is 1 (logic true), if passengers are allowed in the vehicle at the end of the trip (occupancy at the end of the trip > 0). |
| | ExternalVehicleJour neyRef (FahrtBezeichner) ³⁾ | char(128) | | | Country wide for operating day unique ID for the journey |
| | TARGET_ENERGY _QUANTITY (ZIEL_ENERGIE_M ENGE) | decimal (6) | 1999999 (0) | CMS | Target energy quantity on starting the trip after charging in Wh. Planning variable, relevant for monitoring the energy balance in the control system. For the first trip of a block, this value corresponds to the value of the energy quantity after charging in the depot. |

- With AVLC operation it is necessary to clarify whether the run numbers are actually required in the system. If yes, the value range is 1 99. If the transport company and all system components work exclusively with the block number however, the run number should not be entered.
- ²⁾ This is required in order to supply the balance matching processes in every AFZ system with the information concerning whether the passenger occupancy at the start or end of a trip is permitted to be > 0. It is not concerned with the actual number of occupants. This cannot be "planned" in advance. The system only needs to know whether or not passengers can remain seated in the vehicle at the end of the trip or already be on board at the start of the trip.

These situations normally occur on circular routes or after route reassignments. This is also common on school bus journeys, as the students need to travel on several trips before reaching their destination. There is basically no defined "trip end" at which there is zero occupancy (with the exception of drivers and on-board staff).

A through-running service can also be used where a normal trip (trip type 1) leads into a depot trip (trip type 2 and higher) or when a depot trip (trip type 2 and higher) leads into a normal trip (trip type 1). The through-service is then valid from or to the next normal trip respectively.

This covers the situation in which passengers on a shunting trip (or relocation trip) within a stop may stay on board the vehicle, even though this trip is represented as a depot trip within the system.

| The primary key of JOURNEY is a secondary key in | JOURNEY has the following secondary key(s): |
| | · |
| JOURNEY_WAIT_TIME | BASE_VERSION |
| CHARGING_PROCESS | LINE |
| | DAY_TYPE |
| | TIMING_GROUP |
| | JOURNEY_TYPE |
| | BLOCK |
| | |

Note on scheduling vehicle blocks: There are basically two ways of scheduling vehicle blocks from the various relations.

- All the trips, including deadhead trips are fitted into the JOURNEY (REC_FRT) relation. The DEAD_RUN (REC_UEB) and DEAD_RUN_TIME (UEB_FZT) relations are not used. The advantage lies in the fact that a JOURNEY_NO (FRT_FID) and the valid travel time group exist for each deadhead trip as well as for the other journeys in this relation.
- 2. All the journeys, apart from the deadhead trips, are stored in JOURNEY (REC_FRT). If, in the course of a vehicle block, it is discovered in JOURNEY (REC_FRT) that the point number of the destination of the x-th journey does not agree with the point number of the beginning of the x+1-th journey, then a suitable deadhead trip has to be sought in the DEAD_RUN (REC_UEB) table. The valid travel time group for the deadhead trip is taken from or corresponds to that of the x-th journey. If the deadhead trip has no predecessor (x-th journey is missing, e.g. when departing from the depot), then the travel time group is taken from the x+1-th journey.

Note on "missing" vehicle blocks: see 9.8.3

20.04.2021

Note: With AVLC operation it is necessary to clarify whether deadheads can be used to create layover areas.

9.8.2 JOURNEY_WAIT_TIME (REC_FRT_HZT) (308)

Description:

Journey waiting time at the bus stop. The waiting time is made up of the time it takes for passengers to board and alight including any waiting time (e.g. arriving in time to ensure the connection).

| Table | Table: JOURNEY_WAIT_TIME (REC_FRT_HZT) | | | | | | |
|-------|--|-----------|-------------|-----------------|-------------|--|--|

|--|---|
| The primary key of BLOCK is a secondary key in | BLOCK has the following secondary key(s): |
| JOURNEY | BASE_VERSION |

CHARGING_PROCESS

BASE_VERSION DAY_TYPE VEHICLE_TYPE

Note:

For certain import systems, information on vehicle blocks is not necessary (e.g. passenger counting, counting of disabled passengers and timetable information). That is why in some transport companies, no block scheduling is carried out. In such a case, the exporting system assigns a "0" to BLK_ID (BLOCK_ID (UM_UID)) in the interface file (NULL in the database). Therefore, the block table (9.8.3) becomes an optional table, except when updating an AVLC.

9.9 Transfer data

The **JOURNEY_CONNECTION (EINZELANSCHLUSS)** and **INTERCHANGE (REC_UMS)** tables described in this chapter allow the transfer of connection definitions and their validities, for example from a planning system to an AVLC. This ensures the AVLC has the necessary information to monitor and protect transfers. Transfer protection of third-party vehicles is also supported by the CPIID (ASBID), <u>RouteID (LinienID)</u> and <u>DirectionID (RichtungsID)</u> attributes in accordance with VDV Recommendation 453 ("Real-time Data Interface").

9.9.1 JOURNEY_CONNECTION (EINZELANSCHLUSS) (432)

Description:

These transfer definitions are imported into the AVLC where they are subsequently used by the transfer protection function.

| Table | Table: JOURNEY_CONNECTION (EINZELANSCHLUSS) (432) | | | | | | |
|-------|---|--|--|--|--|--|--|
| Key | Key Attribute Name Data Value range Required Description type for | | | | | | |

| P1 | BASE_VERSION (BASIS_VERSION) | decimal(9) | >0 | AVLC | Label of the general version |
|----|--|-------------|-------------|------|--|
| P2 | CONNECTION_ID (EINAN_NR) | decimal (5) | 1 - 32764 | AVLC | Unique number for a transfer definition |
| | CONNECTION_NAM E (ANSCHLUSS_NAM E) | char(40) | ISO 8859-1 | AVLC | Text to name the transfer |
| | PRIORITY (ANSCHLUSS_GRU PPE) | char(6) | ISO 8859-1 | | Free grouping of transfers to reflect priorities. |
| | CONTROL CENTRE CODE (LEITSTELLENKENN UNG) | decimal (3) | 1 - 255 (0) | AVLC | Identification of the control centre with which transfer information is exchanged (see VDV- 453). If the feeder belongs to the third-party control centre, the attribute is filled with a value of > 0. The value of this attribute defines which combination of attributes are read: If the Control Centre Code = 0 the following attributes • FEEDER_LINE_NO (ZUB_LI_NR) |

| | | | | 1 |
|---|----------------|------------|----------|--|
| FEEDER_LINE_NO (ZUB_LI_NR) | decimal (6) | 1 - 999 | | FEEDER_DIRECTION (ZUB_LI_RI_NR) FEEDER_STOP_NO (ZUB_ORT_REF_ORT) If Control Centre Code (Leitstellenkennung) > 0 LINE_ID (LinienID), DIRECTION_ID (RichtungsID) and ConnectionLinkRef (ASBID) are are supplied. Attributes that are not supplied are filled with 0 or "". Route number of the feeder (VDV DM 4.1: LINE_NO (LI_NR) identifier of the transport supply in terms of route |
| | | | | or area) ²⁾ |
| FEEDER_DIRECTIO N (ZUB_LI_RI_NR) | decimal (3) | 1 - 2 (0) | | Direction of the feeder route (VDV Data Model 4.1: DIRECTION (LI_RI_NR) identifies the route direction) |
| FEEDER_STOP_N O (ZUB_ORT_REF_ ORT) | decimal (6) | >01) | | Stop where passengers alight from a feeder vehicle for the transfer |
| FEEDER_POINT_TY PE (ZUB_ONR_TYP_NR) | decimal (2) | >0, NULL | Optional | Point type of the feeder point. |
| FEEDER_POINT_NO (ZUB_ORT_NR) | decimal (6) | >0, NULL | Optional | Point where the passengers leave the feeder vehicle |
| FROM_STOP_NO (VON_ORT_REF_OR T) | decimal (6) | >0, NULL | Optional | to catch the connection (transfer). Stop, from where the feeder vehicle approaches the feeder stop |
| <u>LINE_ID (LinienID)</u> | char(6) | ISO 8859-1 | | Identifier of the feeder route; must be supplied instead of FEEDER_LINE_NO (ZUB_LI_NR) if the feeder belongs to a third-party control centre. |
| <u>DirectionID</u> (<u>RichtungsID)</u> | char(6) | ISO 8859-1 | | Identifier of the feeder route; must be supplied instead of FEEDER_DIRECTION (ZUB_LI_RI_NR) if the feeder belongs to a third-party control centre. |

| | | 1 | 1 | [|
|--|----------------|------------|----------|--|
| ConnectionLinkRef <u>(ASBID)</u> | char(10) | ISO 8859-1 | | Connection protection area identification It must be agreed by the participating control centres and is only supplied if the feeder belongs to a third-party control centre Number of a systematic transfer |
| FETCHER_LINE_NO (ABB_LI_NR) | decimal (6) | 1 - 999 | AVLC | Route number of the receiver (VDV Data Model 4.1: UMS_Z_NR identifies the route to which the passengers transfer.) ²⁾ |
| FETCHER _ DIRECTION (ABB_LI_RI_NR) | decimal (3) | 1 - 2 (0) | AVLC | The direction determines the destination of the routes (VDV DM 4.1: UMS_Z_RI identifies the route direction of the destination route) ²⁾ |
| FETCHER_STOP_N O (ABB_ORT_REF_OR T) | decimal (6) | >01) | AVLC | Stop at which the passengers board the receiver vehicle of the transfer (VDV Data Model 4.1: UMS_Z_ORT is the location number of the point on the trip from which the journey continues after the transfer) ² |
| FETCHER_POINT_T YPE (ABB_ONR_TYP_NR) | decimal (2) | >0, NULL | Optional | Stop type of the receiver point. |
| FETCHER _POINT_NO (ABB_ORT_NR) | decimal (6) | >0, NULL | Optional | Stop at which the passengers board the receiver vehicle of the transfer. |
| TO_STOP_NO (NACH_ORT_REF_O RT) | decimal (6) | >0, NULL | Optional | Stop via which the receiver vehicle continues its journey |

¹⁾ IN AVLC operation, it is necessary to check whether the entire range of values can be used. Many transport authorities use equipment that only allows a range of 1 - 9999.

²⁾ Thus the attribute names are different from what might have been expected from the first part of this recommendation or VDV Data Model 4.1.

Note: With the feeder or receiver stopping point, it is possible to include only those feeder and receiver vehicles that serve the exact stopping point. If this attribute is not specified, all feeders and receivers of the given route/direction are used.

With the from- and to-stops, it is possible to select a more accurate path for the feeder or receiver on the given route/direction. In this situation, the system only considers the patterns that travel via the "from-stop" to the feeder or travel away from the receiver via the "to-stop". If these attributes are not specified, all feeder and receiver patterns for the given route/direction are taken into consideration.

452V1_6__SE.DOCX 20.04.2021

9.9.2 INTERCHANGE (REC_UMS) (232)

Description:

The protection of transfers may be restricted to certain day types and times. A transfer definition therefore, can have different validities. Depending on the time of day, transfer monitoring can use different interchange and delay times.

(Description of interchange possibilities or systematic connections)

| Table | Table: INTERCHANGE (REC_UMS) (232) | | | | | | | |
|-------|------------------------------------|-----------|-------------|-----------------|-------------|--|--|--|
| Key | Attribute Name | Data type | Value range | Required for | Description | | | |

| P1 | BASE_VERSION (BASIS_VERSION) | decimal (9) | >0 | AVLC | Label of the general version |
|----|---|----------------|------------|------|---|
| P2 | CONNECTION_ID (EINAN_NR) | decimal (5) | 1 - 32764 | AVLC | Unique number for a transfer definition |
| P3 | DAY_TYPE_NO (TAGESART_NR) | decimal (3) | 1 - 999 | AVLC | Day type label |
| P4 | VALIDITY_START_ TIME (UMS_BEGINN) | decimal (6) | 0 - 129599 | AVLC | Time in seconds after midnight for the validity start time of the transfer definition within a day type. |
| P5 | VALIDITY_END_TI ME (UMS_ENDE) | decimal (6) | 0 - 129599 | AVLC | Time in seconds after midnight for the validity end time of the transfer definition within a day type. |
| | INTERCHANGE_S TANDARD_DURAT ION (UMS_MIN) | decimal (5) | 0-65532 | AVLC | Minimum transfer time for a transfer connection. Minimum changeover time in seconds for a passenger to get from the feeder stopping point to the receiver stopping point. |

| INTERCHANGE_M AXIMUM_DURATI ON (UMS_MAX) | decimal (5) | 0-65532 | AVLC | Maximum transfer time for a transfer connection. Maximum time in seconds, in which the passenger can reasonably be assumed to make the transfer (inclusive of waiting time), so that the transfer can still be regarded |
|---|----------------|---------|------|--|
| | | | | as a transfer. This attribute is used to form transfer pairs. |
| MAXIMUM_WAIT_ TIME (MAX_VERZ_MAN) | decimal (5) | 0-65532 | AVLC | Maximum timetable deviation in seconds that is allowed for the receiver as a consequence of a transfer protection decision taken manually by a supervisor. |
| MAXIMUM_WAIT_ TIME_AUTO (MAX_VERZ_AUT O) | decimal (5) | 0-65532 | AVLC | Maximum timetable deviation in seconds that is allowed for the receiver as a consequence of an automated connection protection decision by the system. If this value is exceeded, it must be acknowledged by the dispatcher so that the transfer continues to be monitored. |

Use of font types for attribute names:

Normal = the name is the same as in VDV Data Model 4.1

Italics = not in VDV Data Model 4.1

Underlined = VDV453

10 Extension of the zones

The aim of the extension to the Standard VDV452 "Route Network / Timetable" Interface described in this chapter is to model the zones or administrative units.

Zones are spatially connected zones that are used in the planning programs to calculate the mileage provided by the various administrative units. The VDV452 interface must be extended before this planning data can also be used for AVLC operation. This modelling is not intended for the depiction of tariff models.

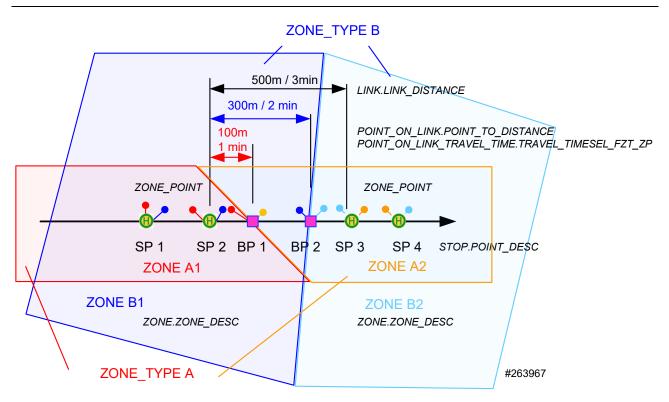

The interface is extended with the ZONE (FLAECHEN_ZONE) table. This table lists all zone types and the various operational zones associated with each type. The operational zones of a zone type are connected and must not overlap.

The stops, depot points and border points are assigned to the zones in which they lie. The ZONE_POINT (FL_ZONE_ORT) table is used for this assignment.

If 2 consecutive stopping points and/or depot points of a route are located in different zones, a border point must always be placed between them. This border point is saved in the STOP (REC_ORT) table with POINT_TYPE (ONR_TYP_NR) = 7 (border point). This border point is then assigned to the area in ZONE (FLAECHEN_ZONE) via the ZONE_POINT (FL_ZONE_ORT) table. If the border point forms the intersection between 2 ZONEs (FLAECHEN_ZONE), it is always assigned to both ZONEs (FLAECHEN_ZONE). The distance between the stopping point and the border point is stored in the POINT_ON_LINK (REC_SEL_ZP) table and POINT_TO_DISTANCE (SEL_ZP_LAENGE) attribute. The distance is always specified with reference to the start stopping point of the pattern. The travel time from the stopping point to the border point is stored in the POINT_ON_LINK_TRAVEL_TIME (SEL_FZT_FELD_ZP) table and TRAVEL_TIME (SEL_FZT_ZP) attribute.

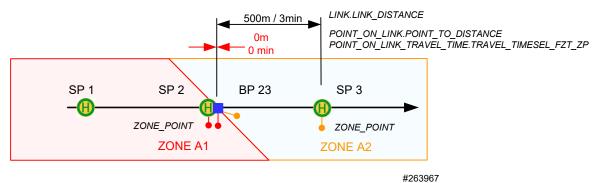

The picture below shows 4 stopping points (SP 1 to SP 4) which lie within 2 zone types and a total of 4 zones. Stopping points SP1 and SP2 are assigned to zones A1 and B1. Stopping points SP3 and SP4 are assigned to zones A2 and B2. The path runs from SP1 in the direction of SP4. BP1 describes the boundary between zones A1 and A2 and is therefore assigned to both zones. Border point BP1 lies 100m after stopping point SP2 on the path to SP3. The vehicle requires 1 minute to travel to the border point. BP2 describes the boundary between zones B1 and B2 and lies 300m after stopping point SP2 on the path to SP3. The vehicle requires 1 minute to travel to the border point. BP2

If the border point coincides exactly with a stopping point, there are a possible 4 scenarios to consider. In all the scenarios depicted below, the border point sits directly at the stopping point and border point BP23 is assigned to zones A1 and A2.

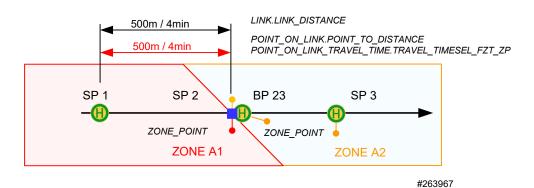

The route path cuts the boundary and the stopping point belongs to zone A1:

In this situation, border point BP23 is located on the path between SP2 and SP3 with POINT_TO_DISTANCE (SEL_ZP_LAENGE) = 0.

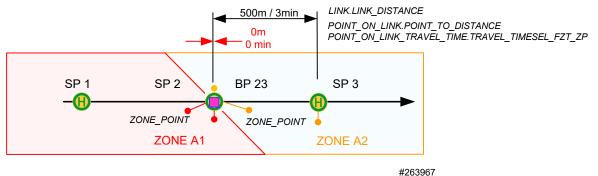

The route path cuts the boundary and the stopping point belongs to zone B1:

Zones

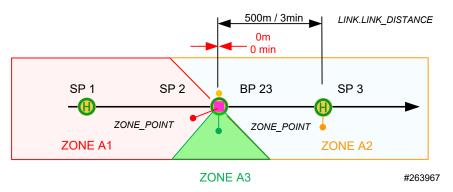

In this situation, border point BP23 is located on the path between SP1 and SP2 with POINT_TO_DISTANCE (SEL_ZP_LAENGE) = distance between SP1 and SP2.

The route path cuts the boundary and the stopping point belongs to zones A1 and A2:

In this situation, border point BP23 is located on the path between SP2 and SP3 with POINT_TO_DISTANCE (SEL_ZP_LAENGE) = 0.

The route path skirts the boundary but doesn't cut across it. The stopping point belongs to A3 but not A1 or A2:

In this situation, border point BP23 is located on the path between SP2 and SP3 with POINT_TO_DISTANCE (SEL_ZP_LAENGE) = 0.

11 Electromobility

11.1 Glossary

| Term | Explanation |
|--------------------------------|--|
| Battery chemistry | Chemical composition of a battery. |
| Battery usable capacity | Actually usable battery capacity in consideration of the SoH. |
| Battery type | Battery characteristics such as nominal battery capacity, battery chemistry etc. |
| Coupling type | Type of coupling between the vehicle and the charging station . |
| Charged energy quantity | Quantity of energy already charged during a charging process . |
| Charging infrastructure | Group of devices (e.g. charging station) and accessories (e.g. cable) for charging electric vehicles. The charging infrastructure has standard communication interfaces to the management system and electric vehicle. |
| Charging power | Power for charging. |
| Charging management system | System for defining a charging strategy for vehicles in the depot, taking account of the available power consumption and the operational requirements. |
| Charging finalisation duration | Time needed to finalise the vehicle after the charging process . |
| Charging profile | A charging profile describes a charging possibility. A charging point or a vehicle can each support more than one charging profile. |
| Charging plan | Workflow indicating when and how which vehicle should be charged. |
| Charging point | A local point where charging takes place. |
| Charging station | The charging station groups together charging points with the same supply line whose energy and power demand is viewed as a unit by the energy supplier and billed separately. |
| Charging voltage | Current voltage for calculating how long charging will take. |
| Charging preparation duration | Period of time from arrival at the charging point until the current flows. |
| Charging process | The process of charging, which begins with the charging preparation duration and ends with the charging finalisation duration. |
| Charging device | Device for charging electric vehicles, e.g. charging pole, pantograph. |
| Grid voltage | Grid voltage at a charging station before the transformer. |

| Term | Explanation |
|--------------------------|--|
| In motion charging | Charging from the overhead wire while driving (not within scope of this document). |
| Load peak / Peak load | Peak load refers to brief high power demand occurring in the power grid or other supply grids. The load peak is the moment when the peak load is reached. |
| Nominal battery capacity | Nominal battery capacity in new state as indicated by the OEM. |
| Nominal voltage | Voltage needed by the vehicle in normal operation. |
| Opportunity charging | The vehicles are loaded at selected bus stops. This increases the range of the buses without returning to the depot and in compliance with the timetable. |
| Optimising charging | Charging optimization concerns the control of charging processes in order to distribute the available power to the charging points and thereby avoid load peaks. It also aims to ensure that the vehicles have sufficient energy available to meet the requirements for the next day operational day. |
| Plug type | Type of plug connecting the vehicle and the charging station. |
| State of Charge | The SoC value indicates the remaining available capacity of a battery in relation to its useable capacity. The state of charge is indicated as a percentage of the fully charged state. |
| Target energy quantity | Target energy quantity in the vehicle on departure after charging. |

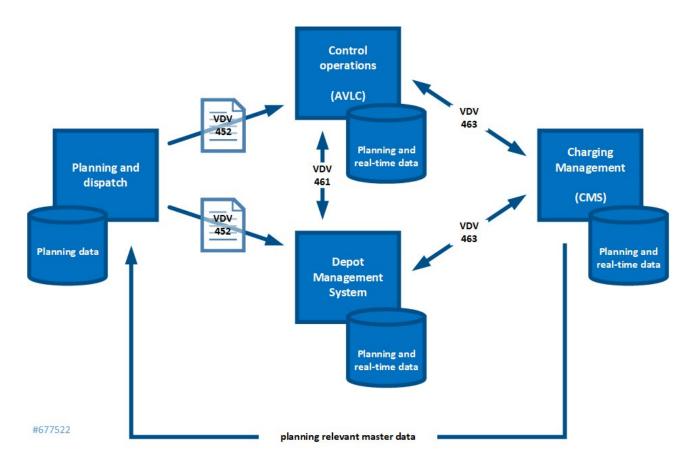

11.2 Initial situation

Increasing numbers of transport companies are making or have made specific plans to procure electric vehicles as part of the on-going renewal of their bus fleet. Three aspects are relevant here:

- 1. Saving energy
- 2. Optimising charging
- 3. Dealing with the limited range

Optimising charging and dealing with the limited range take place primarily on the planning level. All relevant parameters are taken into account when scheduling the blocks and services and in dispatch planning for vehicles and drivers. Consequently, the planning data interface to AVLC and depot management system should be extended.

The next figure defines the context for this document.

Planning (summarised here as "planning and dispatch") refers primarily to the following detailed planning activities which can be grouped together in some cases for better optimisation: timetable, rotation plan, duty roster, personnel duty roster, vehicle operating timetable.

This is joined by a new charging plan for electric vehicles. It takes account of both the fixed charging infrastructure and the electrical equipment present in the vehicles, particularly the battery. The charging plan

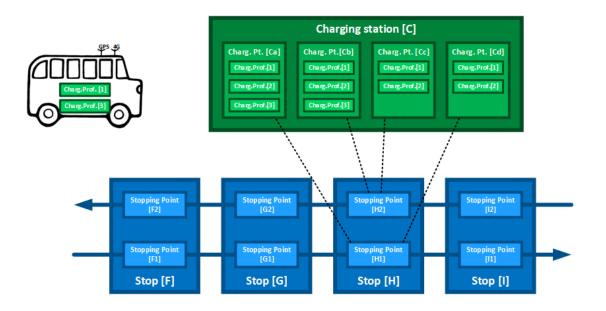

ensures the load is spread out as evenly as possible across the existing charging infrastructure to avoid expensive charging peaks. As far as possible, it is immune to weather-related changes in energy consumption.

In conjunction with the regulations on drivers' working hours, the charging plan results in various restrictions for control operations. These become relevant if incidents (e.g. traffic jams, blocked roads, vehicle failures) cause disruptions.

The additional marginal conditions make the work processes increasingly complex so that the dispatcher in the control centre will need support from the control system. In turn, the control system must be able to work with the same information that was used when producing the planning data. The planning data should be recorded just once in the planning system and are transferred to the control system together with the other planning data (route network, timetable, fleet) using the existing interface.

11.3 Recharging at the stop

Vehicles are recharged on route at a central stop (e.g. at a railway station in the town centre that is served by several cross-city routes). Every stopping point has two stopping positions equipped with a charging device, in other words, two charging points. One charging point can be allocated to several stopping points. The stopping points served by several routes and has a long stopping zone. A driver approaching the stopping point with his vehicle uses one of the two charging points. The vehicle is recharged and there is also a changeover of passengers.

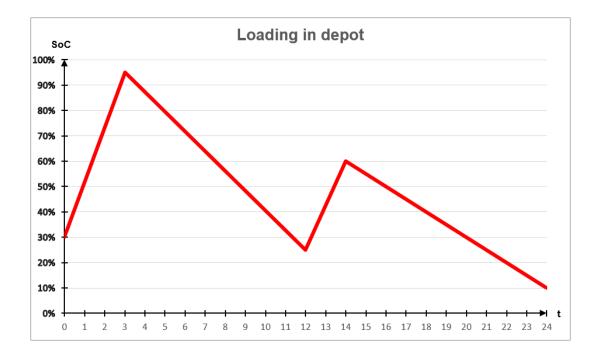

The charging points have a joint supply line (medium voltage), which is transferred to the charging voltage for the charging points. In this case, the charging station corresponds to a stop and the charging points are allocated to its stopping point.

11.4 Recharging in the depot during the block

Recharging in the depot corresponds to recharging at the stopping point or layover link. The charging points can be allocated to the productive terminal stopping point (of the last trip) or the productive start stopping point (of the next trip). As a rule, unproductive trips will be necessary to reach the depot.

11.5 In motion charging

On principal routes, vehicles have the possibility of recharging during the trip. Pantographs are used for this purpose. The timetable can be used to single out the vehicles in order to reduce the load on the substation. At the moment, this interface deals only with recharging at the stop and recharging in the depot.

BASE_VERSION DAY_TYPE BLOCK JOURNEY LINE ROUTE_SEQUENCE CHARGING_POINT CHARGING_PROFILE

For each charging process within (or at the beginning or at the end of) a trip, the following rules apply:

- The charging process is timed such that it fits within the dwell time at a stop point (or ends before the start of the journey or starts after the end of the journey). The stop point determined in this way has an assignment to the charging point referenced by the charging process.

- The charging profile referenced by the charging process is available at the charging point (assignment between charging profile and charging point) and is supported by the vehicle type assigned to the block (assignment between charging profile and vehicle type).

- LADE_LFD_NR must always be an continuous sequence of ascending natural numbers in this context.

12 European Standards

With regard to the transmission of information relating to the route network and timetable, the "NeTEx" interface has been developed on the basis of the European "Transmodel" data model.

12.1 NeTEx and VDV Specification 462

VDV Recommendation 452 was tabled by the CEN task force when creating CEN-TS 16614 NeTEx. This means that all data elements of VDV Recommendation 452 have a corresponding element in NeTEx.

An introduction to NeTEx and a description of the usage as an alternative to this specification gives VDV Specification 462

Links:

www.vdv.de/oepnv-datenmodell.aspx www.vdv.de/netex.aspx. www.netex-cen.eu

12.2 Comparison of VDV452 German - English - Transmodel

Content of TRANSMODEL

Contrary to the German VDV Data Model, TRANSMODEL is not a *logical data model*, which can be used directly as the starting point for the definition of a database model of a specific application, but a *conceptual data model* with a focus on the semantic description of a realistic excerpt according to methodical rules and pre-specified descriptive elements.

The data dictionary underlying the TRANSMODEL is restricted to a definition of the conceptual entities and their most important attributes (mainly in connection with identification) as well as the representation of the logical network of relationships between the individual entities. There is no definition of the data types or lengths, units or value ranges of the attributes, nor does it take into account any application-specific optimisation of the data structures in the context of performance or memory requirements. The challenge was to offer transport authorities and developers a uniform benchmark for semantic data modelling.

There is a downloadable table on the VDV website at <u>WWW.VDV.DE</u>, which compares the German VDV Recommendation 452, it's English translation and the data objects of TRANSMODEL.

The corresponding tables of the VDV Data Model can therefore be construed as realistic implementations of the conceptual TRANSMODEL entities

The European standard EN12896, known as "Transmodel" (from EN12896, "Foreword")

Transmodel 5.1 is a reference standard which provides a conceptual data model for use by organisations with an interest in information systems for the public transport industry.

As a reference standard, it is not necessary for individual systems or specifications to implement Transmodel. However, it must be possible to describe (for those elements of systems, interfaces and specifications which fall within the scope of Transmodel):

The aspects of Transmodel that they have adopted and the aspects of Transmodel that they have chosen not to adopt.

For an organisation wishing to specify, acquire and operate information systems, Transmodel may be distilled, refined, or adapted to form a comprehensive data model for the organisation, or specific data models for database design or interface specification.

For an organisation wishing to design, develop and supply information systems, Transmodel may be distilled, refined, or adapted to form a comprehensive data model for the product suite.

13 Possible future developments and options

This appendix is provided to help avoid contradictions between developments for specific projects: The additional data elements listed here must not under any circumstances be used in other projects with different meanings.

If a data element is required in another project and there is already an element with the same meaning listed here, it is essential that the label, format and length stated in this appendix is used.

All users of this VDV Recommendation are requested to report any customised extensions immediately to VDV, including relations, value range changes or additional data elements. These are published at <u>www.vdv.de/solldatenschnittstellen</u> and will be included in a later version of this recommendation.

This includes, for example, two alternative data storage concepts for the calendar ("differential validity model" and "calendar extension").
